

## MM209 Programming Assignment (Report)

Instructors: Prof. Vishwanathan Nurni and Prof. Ashwini Yella

### Group members:

1. 190110053: -Neha Parasharam Jadhav
2. 190110074: -Rhythm Shah
3. 190110078: -Sahensu Soni

**P7) Write a program which will generate phase diagram for Al<sub>2</sub>O<sub>3</sub>-Cr<sub>2</sub>O<sub>3</sub> isomorphous system. Assume ideal solution for both solid and liquid phases.**

- **Assumptions:**
  1. Solid and liquid phases form ideal solutions (Given) i.e., ideal solution model and complete miscibility in solid and liquid phases can be assumed.
  2. Total Pressure = 1atm
  3. Phase diagram is the 2D representation with composition of solutions (mol fraction (X)) along x axis and Temperature (in Kelvin) along y axis.
  4. The  $\Delta C_p$  for pure solid  $\rightleftharpoons$  liquid eqm is 0 J/K/mol.
- **Methodology/Principle used for solving the above problem:**
  - Since the system is isomorphous (Given),  $\Delta H_{\text{mix}}=0$  Joules/mol for the solution. The solid and liquid phases follow ideal model solution. This is why, this system gives the most ideal and simplest phase diagram as shown in the graph below.
  - The  $\Delta G_0$  for pure liquid  $\rightleftharpoons$  solid eqm is zero only at the melting temperature of pure solid. In a two-component system, equilibrium can be achieved at any temperature between the melting temperatures of two pure solids.
  - The equations below explain that at any Temp (T) between  $T_{\text{melting}}$  of pure solids, equilibrium between solid and liquid can be achieved which results in different compositions of solid phase and liquid phase at T.
  - $\text{Cr}_2\text{O}_3 (\text{s}) \rightleftharpoons \text{Cr}_2\text{O}_3 (\text{l})$  - (i)
  - $\text{Al}_2\text{O}_3 (\text{s}) \rightleftharpoons \text{Al}_2\text{O}_3 (\text{l})$  - (ii)

$\Delta C_p = 0$  J/K/mol (for above equilibrium equations)

$$\Delta G_0 \text{ Melting, Cr}_2\text{O}_3 = \Delta H_0 \text{ Melting, Cr}_2\text{O}_3 - T(\Delta H_0 \text{ Melting, Cr}_2\text{O}_3 / T_{\text{melting, Cr}_2\text{O}_3})$$

$$\Delta G_0 \text{ Melting, Al}_2\text{O}_3 = \Delta H_0 \text{ Melting, Al}_2\text{O}_3 - T(\Delta H_0 \text{ Melting, Al}_2\text{O}_3 / T_{\text{melting, Al}_2\text{O}_3})$$

$$\Delta G_1 = \Delta G_0 \text{ Melting, Cr}_2\text{O}_3 + RT \ln(a_{\text{Cr}_2\text{O}_3(\text{l})} / a_{\text{Cr}_2\text{O}_3(\text{s})}) \text{ for eqn(i)}$$

since, the liquid solution and solid solution both are ideal and  $P_T$  is 1 atm we can write

$$a_{\text{Cr}_2\text{O}_3(\text{s})} = X_{\text{Cr}_2\text{O}_3(\text{s})}$$

$$a_{\text{Cr}_2\text{O}_3(\text{l})} = X_{\text{Cr}_2\text{O}_3(\text{l})}$$

At equilibrium  $\Delta G = 0$ ; this gives us the following equation;

$$\Delta G_1 = \Delta G_0 \text{ Melting, Cr}_2\text{O}_3 + RT \ln (X_{\text{Cr}_2\text{O}_3(\text{l})} / X_{\text{Cr}_2\text{O}_3(\text{s})}) = 0 \quad \text{-(iii)}$$

Similarly, using

$$X_{\text{Al}_2\text{O}_3(\text{s})} + X_{\text{Cr}_2\text{O}_3(\text{s})} = 1$$

$$X_{\text{Al}_2\text{O}_3(\text{l})} + X_{\text{Cr}_2\text{O}_3(\text{l})} = 1$$

we obtain;

$$\Delta G_2 = \Delta G_{0 \text{ Melting, Al}_2\text{O}_3} + RT \ln\left(\frac{(1-X_{\text{Cr}_2\text{O}_3(l)})}{(1-X_{\text{Cr}_2\text{O}_3(s)})}\right) = 0 \quad \text{-(iv)}$$

- At any temp (T), we can obtain different equilibrium compositions ( $X_{\text{Cr}_2\text{O}_3(l)}$ ) of the solid ( $X_{\text{Cr}_2\text{O}_3(s)}$ ) and liquid solutions respectively from equation (iii) and (iv).
- This makes us possible to get the phase diagram for such system as shown below.

- **Phase diagram plot:**

(We have used **MATLAB** to obtain the phase diagram plot.)

- Numerical Data used includes

1.  $\Delta H_{\text{melting}}(\text{Al}_2\text{O}_3) = 107500 \text{ J/mol}$
2.  $\Delta H_{\text{melting}}(\text{Cr}_2\text{O}_3) = 117400 \text{ J/mol}$
3.  $\Delta S_{\text{melting}}(\text{Al}_2\text{O}_3) = 46.26 \text{ J/K/mol}$
4.  $\Delta S_{\text{melting}}(\text{Cr}_2\text{O}_3) = 46.35 \text{ J/K/mol}$

- Source for numerical data:

INTRODUCTION TO THE THERMODYNAMICS OF MATERIALS (FOURTH EDITION)-  
David R. Gaskell

- **Explanations of the plots and results:**

- Region I is a single-phase region (Liquid) with degrees of freedom,  $F=1$ .
- Region II is two phases region (Liquid  $\rightleftharpoons$  Solid) with  $F=2$ .
- Region III is single phase region with  $F=1$ .
- Line separating regions I and II is called liquidus and line separating regions II and III is called solidus.
- Point A on y axis is  $T_{\text{Melting}}$  of Al<sub>2</sub>O<sub>3</sub> and point B is  $T_{\text{Melting}}$  of Cr<sub>2</sub>O<sub>3</sub>
- The plot shows mol fraction of Cr<sub>2</sub>O<sub>3</sub> along x axis and temperature (in Kelvin) along y axis.
- At temp T as shown by red horizontal line, we obtain different equilibrium compositions for solid and liquid phase respectively.
- Eqm value of  $X_{\text{Cr}_2\text{O}_3(l)}$  i.e., (liquid eqm composition) is given by point C on x axis and  $X_{\text{Cr}_2\text{O}_3(s)}$  i.e., (solid eqm composition) is given by point D on x axis.
- Therefore, at Temp T if we fix the eqm composition of solid solution we obtain a fixed eqm composition for liquid solution and vice-versa.

- **Contributions made by each member:**
  - Each member contributed equally in developing the code and worked on getting the methodology right for the problem.
  - Sahensu Soni ([190110078](#)) researched and obtained the numerical data needed.
  - Rhythm Shah ([190110074](#)) created the final code and obtained the plots.
  - Neha Parasharam Jadhav ([190110053](#)) worked on the explanations of the results, plots and made the final report.
